

A Telegram bot that saves restricted content 🎬 (videos, photos, documents, audio) from private and public channels — one batch at a time, with per-user login, paid plans, and automatic backup so redeploys never wipe your data. 💾

✨ Features

- 📦 **Batch download** — send a post link + range, the bot fetches every file in order
- ⚡ **File-ID fast path** — instant server-side copy whenever possible (no re-upload)
- 🔐 **Per-user login** — `/login` with phone → OTP → 2FA, each user's session stored separately
- 🚶 **Sequential transfers with flood pacing** — one file at a time + 3s gap between files, so Telegram's FloodWait limits never trip on big batches
- 📂 **Dual delivery** — every file goes to the user's personal chat **and** to a log-group topic folder (one folder per user, never recreated)
- 💎 **Paid plans** — `/paid <user_id> <days>`, lifetime `/allow`, `/users`, `/plan`, `/unallow`
- 🎛️ **Custom settings** — `/settings` panel: rename tag, caption template, replace/remove words, thumbnail, PDF/video watermark, upload method
- 💾 **Redeploy-proof backup** — all data files auto-back up to a private channel and restore themselves on startup
- 🔔 **Force-join gate** — optional updates-channel check on `/start`, `/login` and `/batch`
- 🖼️ **Welcome screen** — photo welcome on `/start` with buttons (Admin Panel, Commands, Disclaimer, Warnings)

🛠️ Tech Stack

- 🐍 Python 3.11
- Pyrogram 2.0.106 (MTProto)
- ☁️ Runs on Koyeb (free Eco tier works)

🚀 Setup

1️⃣ Clone & install

```
git clone <your-repo-url>
cd <repo-folder>
pip install -r requirements.txt
```

2️⃣ Environment variables

Create these in your host (Koyeb → Service → Environment variables):

Variable	Required	What it is
`BOT_TOKEN`	✅	Bot token from @BotFather
`API_ID`	✅	From my.telegram.org
`API_HASH`	✅	From my.telegram.org
`OWNER_ID`	✅	Your Telegram user ID (bot owner)
`LOG_GROUP_ID`	✅	Log group ID (forum/topics enabled) for per-user folders
`BACKUP_CHAT_ID`	⭐ Recommended	Private channel ID for redeploy-proof backup (see below)
`UPDATES_CHANNEL`	Optional	Updates channel for force-join — bare `@username` or numeric ID (not a t.me link)
`START_IMAGE`	Optional	Photo URL or file_id for the `/start` welcome screen (empty = text only)

3️⃣ Run

```
python main.py
```

On Koyeb, connect this repo, set the env vars above, and deploy. Health checks run on port `8080`. ✅

💾 Backup setup (one-time, highly recommended)

Without this, every redeploy wipes logins, plans and settings. With it, everything restores automatically:

1. Create a **private** Telegram channel (only you + the bot).
2. Add the bot as **admin** in that channel.
3. Set `BACKUP_CHAT_ID` to that channel's ID (e.g. `-100...`).
4. Grant one `/paid` or `/allow`, wait ~10 seconds, and confirm `backup:...` files appear in the channel.
5. Redeploy once — startup logs must show `backup restore: <file> OK` lines. 🎉

> ⚠️ **Keep this channel private.** Its backup files contain login session strings. Never share them, and never post them publicly.

🤖 Commands

For users:

Command	What it does
`/start`	👋 Welcome screen + login/access status
`/login`	🔐 Log in with your own Telegram account (phone → OTP → 2FA)
`/logout`	🚪 Remove your saved login
`/batch`	📦 Start a batch from a post link
`/plan`	💎 Check your remaining premium time
`/settings`	🎛️ Customize rename, caption, thumbnail, watermarks
`/cancel`	❌ Cancel the current step or batch
`/help`	❓ Usage guide

For the owner only:

Command	What it does
`/paid <user_id> <days>`	💰 Grant a time-based premium plan
`/allow <user_id>`	♾️ Grant lifetime free access
`/unallow <user_id>`	🚫 Remove all access
`/users`	👥 List paid + lifetime users with remaining days

⚠️ Notes

- 💸 **Payments are manual** (UPI etc.) — there is no automatic payment gateway in this bot.
- 🚶 Transfers are **strictly sequential** by design: one download → one upload → next file.
- 📦 Big batches (500+ files) are best split into chunks of 100–150 files with a short gap between them.
- 🔒 **Never share your `BOT_TOKEN`, `API_ID` / `API_HASH`, or any session string** with anyone, and never commit them to the repo — use environment variables only.
